## Computational Electromagnetic Modeling of SansEC™ Sensors

Computational electromagnetics, computational electrodynamics or electromagnetic modeling is the process of modeling the interaction of electromagnetic fields with physical objects and the environment. It typically involves using computationally efficient approximations to Maxwell's equations and is used to calculate antenna performance, electromagnetic compatibility, radar cross section and electromagnetic wave propagation when not in free space. A specific part of computational electromagnetic

Fig. 12 shows the experimental transmissibility of the LVI with N-EMSD with respect to H. When  $x_0 = 1.5$  mm, the experimental results with different H are shown in Fig. 12(a). When H increases from 13 mm to 17 mm, the peak transmissibility decreases from 3.62 to 3.31 and the natural frequency slightly decreases from 9.46 Hz to 9.14 Hz.
